ABSTRACT
Lignans are naturally occurring compound which exhibits anticancer, anti AIDS, and other biological activities. In the present work, new tetralin intermediates of 6-hydroxy-4-phenyl-1, (4-dihydronaphthalen-1-yl) amino derivatives were synthesized in very good yields by chalcone route. All the products were characterized by spectral and elemental analysis data. The synthesized compounds were analyzed for antiviral activity.

Key words: Podophyllotoxin, Aryl tetraline, Aldol condensation, Simmon smith reaction.

1. INTRODUCTION
The Lignans are a large family of secondary metabolites widely encountered in the plant kingdom. Within this large family of lignans are the aryltetralin lignans 1 and 2 and aryltetralin lignan lactones 3-5 (Figure 1), which have long been recognized as particularly important natural products [1-5].

The most prominent member of this group of natural products is podophyllotoxin (5). This compound, together with analogues 6-8 are aryltetralin lignan lactones isolated from the American Mayapple (Podophyllum peltatum) and related Indian species (Podophyllum emodi) (Figure 2).

These aryltetralin based compounds exhibit biological screening such as antimalarial, antifungal, antibacterial, antimitotic, anti-inflammatory, anticancer, and anti-HIV (AIDS). Researchers had been many synthetic modifications to the podophyllotoxin structure including the generation of the three potent anticancer agents 9, 10, and 11 (Figure 3). Etoposide (9) and teniposide (10) are DNA topoisomerase II inhibitors presently in clinical use for the treatment of many cancers [2,6-15]. In the present study, we have synthesized aryltetralin analogues by chalcone route.

2. CHEMISTRY
In the present work, chalcone route has been chosen with the slight modified experimental procedure to synthesize tetralone ester intermediates and podophyllotoxin analogues and (Scheme 1), the starting material (12a-c) brought by Sigma-Aldrich commercially. Chalcones 13a-c were prepared in excellent yields by Claisen condensation reaction of acetophenone (12a-c) with 3, 4, 5-trimethoxy benzaldehyde in the presence of sodium hydroxide in a water-ethanol mixture. Cyclopropyl keto esters (14a-c) were prepared in good yields by the reaction of chalcones 13a-c with dichlorobenzene in Zn-Cu couple using ether as a solvent. The structure of the compound was based on infrared (IR), 1H nuclear magnetic resonance (NMR), mass spectra, and elemental analysis data. Tetralone ester intermediates were prepared in good yields by the intramolecular Friedel–Crafts alkylation reaction of cyclopropyl keto esters 14a-c in the presence of anhydrous stannic chloride and acetic anhydride in dry dichloromethane. The structure of tetralone esters were based on IR, ¹H NMR, mass spectra, and elemental analysis data [4].

3. EXPERIMENTAL SECTION
Melting points were determined by the open capillary method and are corrected. The IR spectra were recorded on a Fourier transform-IR in KBr disc. The ¹H NMR spectra were recorded on Joel 60 MHz and Joel GSX-400 spectrophotometer using dimethyl sulfoxide as solvent and tetramethylsilane as an internal reference. The chemical shifts are expressed in δ values.

The purity of the compounds is checked by thin layer chromatography on silica gel glass plates in benzene and ethyl acetate as a solvent mixture (7:0.5). The compounds were purified by column chromatography.
compound was loaded into the well (6 mm diameter) made by sterile cork borer, then the plates were covered with par film incubated at 27°C for 7 days. Nystatin and sterile distilled water were used as positive and negative control all over the experiment of 50 µg concentration.

4. GENERAL PROCEDURE FOR THE SYNTHESIS
Commercially available acetophenone 12a-c (6.2 mmol) on claisen condensation with 3,4,5-trimethoxy benzaldehyde (6.2 mmol) give the yellow crystalline chalcone 13a-c (5 g, 0.0196 mole), which on reaction with dichlorobenzene in Zn-Cu (0.005 mole) couple using ether as solvent (20 ml) followed by usual work up yield a dark brown color semi-solid 14a-c. The obtained compound which on reaction with Lewis acid, i.e., stannic chloride (3.826 g, 0.0146 mole) using acetic anhydride (2.98 g, 0.0292 mole) in nitrobenzene (50 ml) followed by work up yield compound 15a-c which on reduction with NaBH₄ followed by brominating yield dark gray color product. The obtained product was reacted with amino acids which gives the product of 16a-c and 17a-c [2].

5. RESULTS AND DISCUSSION

In this context, we have chosen chalcone route with some changes in the experimental procedure and reagents to synthesize tetralin intermediates. The starting material was obtained by commercially. Chalcone 13a-c were prepared in excellent yields by Claisen condensation reaction of acetophenone 12a-c with 3, 4, 5-trimethoxy benzaldehyde in the presence of sodium hydroxide in a water-ethanol mixture. Cyclopropyl ketones 14a-c was prepared in good yields by simmon smith reaction of chalcone. Tetralone ester intermediates 15a-c was prepared in good yields by the intramolecular Freidel-Crafts alkylation reaction of cyclopropyl ketones 14a-c in the presence of anhydrous Stannic chloride and acetic anhydride in dry dichloromethane. The obtained compound was then treated with sodium borohydride in absolute methanol at 0-5°C for 2 h. The resultant product was done brominating with hydrogen bromide in acetonitrile which contain catalytic amount of ether and molecular sieves at 0°C, and finally, the obtained product was then stirred with amino acids in dry tetrahydrofuran which contain triethylamine and tetra butyl ammonium iodide at room temperature for 4 h to get final product 16a-c, 17a-c, 18a-c. The structure of tetralone intermediates was confirmed by IR, \(^1\)H NMR, and mass spectra data. The synthesized compounds were screened for antiviral activity. The results are summarized in Table 1.

6. CONCLUSION

Successfully, we have synthesized new analogues of tetralins. All compounds were characterized by standard spectroscopic techniques; evaluation of the antiviral activity of all new compounds was carried out and proved significant to moderate activity.

7. ACKNOWLEDGMENTS

The authors are thankful to the University of Mysore for providing NMR, Mass spectra, and elemental analysis data for research compounds.
